JMR Policy on Use of Same Data in More than One Manuscript Submitted for Review

1. **Data from Public Sources:** In the manuscript, the authors should disclose which data item(s) they obtained from which public source. Public sources include those that have data available with no or little restrictions (e.g., Bureau of Transportation Statistics, FDA, or scraping using APIs), with access fees (e.g., CRSP, COMPUSTAT), or from research agencies (e.g., KILTS Center, WCAI, Gfk).

2. **Data from Proprietary Sources:** Such data include observational or survey data from a specific organization shared selectively with the authors for research purposes. Any other published papers, or working papers, that use all or part of the same data from the same organization or proprietary source, should be adequately disclosed in the manuscript (e.g., “the data in the current study are also reported in [cite]”) and brought to the attention of the editor in the cover letter. If the data are used in another working paper, then a blinded copy of the other paper should be uploaded in Manuscript Central as a supplementary document (the other working paper can be cited as an anonymous source to bring out the difference in how the data are used between the two papers, and to highlight the contribution of the paper submitted to JMR).

3. **Primary Data:** Such sources include experimental and survey/field data collected by the authors for research purposes. Similar to proprietary data, if there are other published papers or working papers that use all or part of the same primary data, these papers should be adequately disclosed in the manuscript (e.g., “the data in the study are also reported in [cite]”) and brought to the attention of the editor in the cover letter. If the data are used in another working paper, then a blinded copy of the other paper should be uploaded in Manuscript Central as a supplementary document (the other paper under review can be cited as an anonymous source to bring out the difference in how the data are used between the two papers, and to highlight the contribution of the paper submitted to JMR).

4. **Use of same data as used in other working papers:** In general, JMR will not consider manuscripts for publication that are based on data from proprietary sources (i.e., #2 above) or primary data (i.e., #3 above) where the same data have also been used in another working paper that is intended for publication, at JMR or elsewhere. The reason for this policy is the concern that as multiple papers undergo separate peer review processes concurrently, the data reported in the papers may begin to overlap, leading to loss of originality. Since we anticipate some ambiguity in these situations, the Editor-in-Chief of JMR will make the final decision.
